

Recovery Manager for Exchange

Discover, compare and export Microsoft Exchange messages

Email is increasingly targeted for electronic discovery investigations, which can take hours, days or even weeks of your valuable time. Stakes are high, with organizations and executives mandated to produce electronic evidence quickly or face hefty fines. At the same time, end users are demanding that organizations provide message-level data recovery services that have previously only been available to VIPs using time-consuming brick-level backups. To ensure your organization can meet these requirements and expectations, email discovery and recovery operations must be fast and efficient.

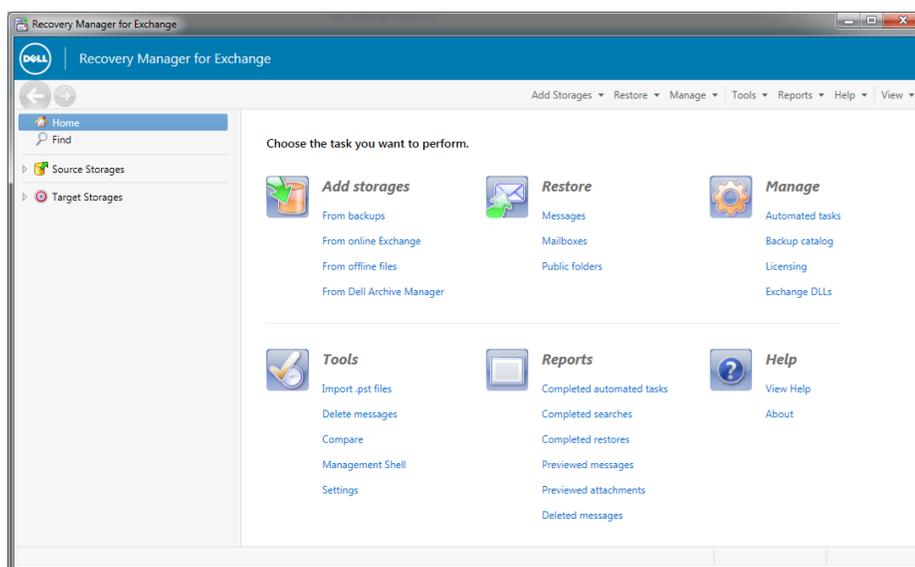

Recovery Manager for Exchange makes discovering and exporting business-critical email data fast and easy—and it does not require a dedicated recovery server. From a single console, you can find and retrieve message-level data from multiple sources in minutes. You can find exactly what you need with intelligent search based on sender, recipient, date, attachment type, subject, message keyword, attachment keyword, or even advanced pattern searching and other custom queries. You can also compare the contents of an online mailbox with a backup mailbox to identify any differences. After the search, Recovery Manager can export the results in a variety of formats to facilitate email discovery requests.

“Trying to restore mailboxes from the Exchange server was something we dreaded—it sometimes took a week. With Recovery Manager for Exchange, it took 90 percent less time.”

Linda Thacker, systems network engineer, Joint Forces Staff College, U.S. National Defense University

Benefits:

- Streamlines searches by using a single console to find and retrieve data from multiple sources, including live Exchange
- Preserves company knowledge that might be needed for investigations
- Leverages investments in existing backup technology with support for the most common backup media and software—while eliminating the need for a dedicated recovery server
- Improves SLAs by providing granular, message-level data recovery
- Improves productivity by automating Exchange discovery and recovery tasks
- Improves security with reporting that shows all searches performed and messages retrieved

Recovery Manager can search and recover Exchange data, including messages, mailboxes, attachments and public folders, from online and a variety of offline backup sources.

System requirements

Operating systems:

Computer must run one of the following operating systems (32-bit or 64-bit edition):

Windows Server 2012/2012 R2

Microsoft Windows 8/8.1

Microsoft Windows 7, and with SP1

Microsoft Windows Server 2008 R2, or with SP1

Microsoft Windows Server 2008 SP1 or SP2

Microsoft Windows Vista with Service Pack 2

Microsoft Windows Server 2003 with Service Pack 2

Microsoft Windows XP with Service Pack 3 (32-bit edition only)

Platform:

1.4 GHz or higher Intel Pentium-compatible CPU

Memory:

512 MB (or more recommended)

Features

Federated search—Search multiple email data sources simultaneously—all from a single interface. Recovery Manager for Exchange covers a wealth of sources, including Office 365, production mailboxes (including archived mailboxes), public folders, personal folders (.pst), offline Exchange database files (.edb), Archive Manager from Dell, and backups, including VSS snapshots.

Multiple export options—Export search results in .pst, .eml, .msg or .txt formats, or to an Exchange online mailbox, archived mailbox, public folder, Office 365, or Archive Manager. Recovery Manager's powerful export capability simplifies the process of collecting email data for e-discovery requests.

Intelligent search—Search number patterns or keywords with an Outlook-like search. Recovery Manager for Exchange enables you to search in the message body, ID, headers, message classes, categories, deleted items, conversation threads, and attachment type and content. You can then expand your search results to include all messages with the same sender, all messages with the same or similar subject, or all related messages.

Comparison of source and target folders—Compare contents in selected source and target containers (storages, mailboxes or folders) and use the results to selectively restore data from the source to the target.

Support for backup software—Find and retrieve data across native Microsoft backups and most major third-party backup software, including NetVault Backup and NetVault FastRecover from Dell, EMC NetWorker, IBM Tivoli, Microsoft Data Protection Manager, and Symantec Backup Exec and NetBackup.

Direct access to tape—Enjoy direct access to the most common tape format backups, including MTF (Microsoft Tape Format) created with Symantec Backup Exec or Windows NT Backup; Open Tape Format (OTF) backups created with EMC NetWorker; and Tape Archive (TAR) backups created with Symantec NetBackup.

Task automation—Automate and schedule searching and exporting of email data. Recovery Manager's Task Wizard provides centralized management and monitoring of automated tasks. To further automate critical tasks, you can use PowerShell to script additional recovery options that will speed up the process of cataloging, restoring, searching and exporting.

Reporting—Get reports containing details on searches performed, messages restored and tasks completed. Recovery Manager's comprehensive reporting helps improve overall security.
